

Insta Temp

Granulated temporary
roof patch

This temporary roof patch is a natural mineral (montmorillonite) which has a unique molecular structure that permits it to absorb many times its original weight in water. **INSTA TEMP's** unique swelling ability allows it to clog roof leaks because once wet, this product swells several times its original size, turns into a gel and creates a temporary barrier which minimizes seepage of impounded fluids. This absorption and subsequent swelling takes place in a matter of minutes. It is ideal for temporary patching that needs to be done on flat roof areas even during a rain shower. **INSTA TEMP** also works well to create a circular dam around where you need to work and pump the water out to create a dry work area in the middle.

Directions: For use on flat roofs only. Spread a layer of **INSTA TEMP** about a half inch thick over the suspected leakage area which must be wet. **INSTA TEMP** will then flow to the trouble spot and create an instant seal. Permanent repairs can then be made as weather permits. For permanent repairs use Omega's **ALL WEATHER PATCH** or Omega's **TOTAL LAST SEAL**.

Areas of Use:

- *high rise buildings
- *cities and counties
- *hospitals
- *hotels
- *churches
- *schools
- *apartment complexes

Health	1
Flammability	0
